

ABSTRACT

FFT demodulation of OFDM symbols is achieved using a frame  
synchronisation pulse generated by deriving absolute values of successive  
5 complex samples of the OFDM symbol, determining the difference between  
such values and other values separated therefrom by a period representing the  
useful part of the OFDM symbol, integrating the difference values over a  
plurality of symbols and determining the sample position representing the  
point at which the integrated difference values substantially change.
